Functions & Arrays

Functions in C

- Syntax like Java methods but w/o public, abstract, etc.
- As in Java, all arguments (well, **most** arguments) are passed by *value*.
- Example:

```
void try_swap( int x, int y ) {  
    int t = x ;  
    x = y ;  
    y = t ;  
}
```

- Doesn't work:
 - x and y are copies of the arguments in the caller.
 - Changing the copy has *no effect* in the caller.

Functions in C

- Functions must be declared before use:
 - *Declare* means specify name, return value, and argument types.
 - Technically functions can default to an implicit declaration. Never rely on implicit declaration!
- Indeed, in C *everything* must be declared before use!

Functions in C

- Functions must be declared before use:
 - *Declare* means specify name, return value, and argument types.
- Indeed, in C *everything* must be declared before use!

```
extern int min(int x, int y) ; // Declaration of min
static int max(int x, int y) ; // Declaration of max

int max_div_min(int x, int y) {
    return max(x, y) / min(x, y) ;
}

int min(int x, int y) { // Definition of min
    return (x <= y) ? x : y ;
}

static int max(int x, int y) { // Definition of max
    return (x >= y) ? x : y ;
}
```

Functions in C

extern: defined elsewhere
(possibly this file).

- Functions must be declared before use:
 - *Declare* means specify name, return value, and argument types.
- Indeed, in C *everything* must be declared before use!

```
extern int min(int x, int y) ; // Declaration of min
static int max(int x, int y) ; // Declaration of max

int max_div_min(int x, int y) {
    return max(x, y) / min(x, y) ;
}

int min(int x, int y) { // Definition of min
    return (x <= y) ? x : y ;
}

static int max(int x, int y) { // Definition of max
    return (x >= y) ? x : y ;
}
```

Functions in C

static: defined and known only in this C source file.

- Functions must be declared before use:
 - *Declare* means specify name, return value, and argument types.
- Indeed, in C *everything* must be declared before use!

```
extern int min(int x, int y) ; // Declaration of min
static int max(int x, int y) ; // Declaration of max
int max_div_min(int x, int y) {
    return max(x, y) / min(x, y) ;
}
int min(int x, int y) { // Definition of min
    return (x <= y) ? x : y ;
}
static int max(int x, int y) { // Definition of max
    return (x >= y) ? x : y ;
}
```

Arrays in C

- Generic form: *type name[size]* ;
- Examples:

```
#define MAX_SAMPLES (100)  
int samples[MAX_SAMPLES] ;
```

Arrays in C

- Generic form: *type name[size]* ;
- Examples:

Array of 100 integers.
Indices run 0 .. 99

NO SUBSCRIPT CHECKS!

NOTE THE USE OF
SYMBOLIC CONSTANT!

```
#define MAX_SAMPLES (100)
int samples[MAX_SAMPLES] ;
```

Arrays in C

- Generic form: *type name[size]* ;
- Examples:

```
#define MAX_SAMPLES (100)  
int samples[MAX_SAMPLES] ;
```

```
int sum = 0 ;  
int i ;  
  
for ( i = 0 ; i < MAXSAMPLES ; ++i ) {  
    sum += samples[ i ] ;  
}
```

Simple summation of array values.

of Technology

Arrays in C

```
#define DIMENSION (50) ;  
double m1 [ DIMENSION ] [ DIMENSION ] ;
```

Arrays in C

A matrix or a 2 dimensional array

Access by **m1[i][j]**

```
#define DIMENSION (50) ;  
double m1 [ DIMENSION ] [ DIMENSION ] ;
```

Arrays in C

Matrix multiplication to show use of double indices.

```
#define DIMENSION (50) ;  
double m1 [ DIMENSION ] [ DIMENSION ] ;  
double m2 [ DIMENSION ] [ DIMENSION ] ;  
double product [ DIMENSION ] [ DIMENSION ] ;  
  
int i, j, k ;  
  
for ( i = 0 ; i < DIMENSION ; ++i ) {  
    for ( j = 0 ; j < DIMENSION ; ++j ) {  
        product [ i ] [ j ] = 0.0 ;  
        for ( k = 0 ; k < DIMENSION ; ++k ) {  
            product [ i ] [ j ] += m1 [ i ] [ k ] * m2 [ k ] [ j ] ;  
        }  
    }  
}
```

Arrays in C

- Arrays are passed to functions by *reference*.

Arrays in C

- Arrays are passed to functions by *reference*.
- Changes to the array contents in the function will be visible to the caller, e.g., array copy.

Arrays in C

- Arrays are passed to functions by *reference*.
- Changes to the array contents in the function will be visible to the caller, e.g., array copy.

```
void acopy( int to[], int from[], int size ) {  
    int i ;  
  
    for( i = 0 ; i < size ; i++ ) {  
        to[ i ] = from[ i ] ;  
    }  
}
```

Arrays in C

- Arrays are passed to functions by *reference*.
- Changes to the array contents in the function will be visible to the caller, e.g., array copy.

```
void acopy(int to[], int from[], int size) {  
    int i ;  
  
    for( i = 0 ; i < size ; i++ ) {  
        to[ i ] = from[ i ] ;  
    }  
}
```

Need not, but may,
give the array size.

Arrays in C - Review

Software Engineering
Rochester Institute
of Technology

- Array size fixed at definition time.
- Good practice (that is, OUR practice) is to use symbolic constants to define array sizes.
- Array indices are integers.
- Legal indices run from 0 to *arraysize* - 1
- C will not prevent you from indexing outside the bounds of the array (no subscript checks).
- Arrays are passed by reference.
