Apple Test Flight - invite beta testers for an app using their email addresses

Will delay Android release for now until we're closer to the iOS release date but Tom is on the Developer Console account and can release the app at any time

UI prototypes are in progress, Stephan can share screenshots of the current iteration

> Lee says to step back and work on use cases before wireframes, "current UI could be confusing," use cases should be separated by the UI
>
> User-oriented langauge like "Create group" instead of "generate code"
>
> "Create group" is less prominent then "join", UI should reflect that
>
> "Really cool feature" if you could have a way to send codes in some way other than writing it down (copy feature so it can be pasted, email feature so you can send it out, etc)
>
> Use tabs - first entry should be "join group," label something like "enter group name". Second entry would be "create group," third entry would be "my groups". My groups would have an "edit" function that brings up minus signs that you can click to leave a group (see similar iPhone feature on i.e. alarms for an example).
>
> When creating group, pre-fill code with concatenated data and let user edit if they want for security purposes

Server setup is in good shape, couple issues migrating the DCS with South but Tom is working through them and documenting his changes to the setup instructions

Will finish the sprint out (ends Sept 26) and then we will discuss a rescope of the requirements for the remainder of the project
